

Script to keep cpu and ram threshold to 80% to avoid crash

Script to be run as root

It is recommended to run this script after restart . This script is not saved as a service till now 22-Oct-2024.

we have kept its name as "resource_control_3.sh"

```
#!/bin/bash

# Threshold in percentage (e.g., 80 for 80%)
THRESHOLD=80

# Number of last processes to kill
N=3

# Interval between checks (in seconds)
INTERVAL=3

while true; do
    # Get the total and used memory in percentage
    MEMORY_USED=$(free | awk '/Mem:/ {printf "%.0f", $3/$2 * 100}')

    # Check if memory usage exceeds the threshold
    if [ "$MEMORY_USED" -ge "$THRESHOLD" ]; then
        echo "Memory usage is at $MEMORY_USED%, exceeding threshold of $THRESHOLD%."

        # Get the last N processes by start time and kill them
        LAST_N_PROCESSES=$(ps aux --sort +start_time | tail -n "$N" | awk 'NR==1{print $2}')

        echo "Killing last $N processes: $LAST_N_PROCESSES"

        for PID in $LAST_N_PROCESSES; do
            kill -9 $PID
            echo "Killed process with PID: $PID"
        done
    else
        echo "Memory usage is at $MEMORY_USED%, under threshold of $THRESHOLD%."
    fi

    # Wait for the specified interval before checking again
    sleep $INTERVAL
done
```

after creating a script file we can run it in background

```
nohup ./resource_control_3.sh > output.log 2>&1 &
```

it will return the pid as a confirmation that script is running in background
